

Real-time Data Management

Course-end Project 2

Description

Objectives

To deploying infrastructure for real-time data management requirements on the AWS Cloud offers a scalable, flexible, and cost-effective solution for organizations aiming to harness the power of real-time data processing.

Problem Statement:

You are given a project to create data in a Kinesis stream that can be copied to the DynamoDB database

Real-World Scenario:

TELEMAX is a company that plans to build networks in rapidly growing, underserved markets around the world. The company offers innovative communications hardware that enables them to create many speed-efficient networking links with inexpensive hardware.

Presently, they need, to deploy an effective architecture for NoSQL based data warehousing built from real-time data being generated that can be analyzed in the future to optimize their topologies continuously. The team decided the AWS cloud is the perfect environment to support their solution needs and they will approach your organization for consultation on the same.

Industry Relevance

Skills used in the project and their usage in the industry are given below:

1. **AWS console** – The AWS Management Console is a web application that includes and references several service consoles for managing AWS services.
2. **Kinesis DataStream** - Amazon Kinesis Data Streams is a serverless streaming data solution that enables capturing, processing, and storing data streams at any scale.
3. **Lambda Function** - AWS Lambda is a serverless compute service that executes user code in response to events and manages the underlying compute resources automatically.
